

An Update to the Survey of Macrolepidopteran Moths Near Vontay, Hanover County, Virginia

J. Christopher Ludwig

Virginia Department of Conservation and Recreation
Division of Natural Heritage
217 Governor Street
Richmond, Virginia 23219

INTRODUCTION

This paper updates the list of macrolepidopteran moth (= "macro moth" or "macro") species collected at a site on the Virginia Piedmont, 2 km W of Vontay in western Hanover County. The study site, methodology, and original species list are given in Ludwig (2000). The list is updated with new collections as well as identifications of additional specimens collected during the original study period. The new collections extend the study period from two years (30 October 1996 to 28 October 1998) to nearly four years (30 October 1996 to 14 September 2000) and increase the number of collection nights from 311 to >400. The species list from this study, along with others being gathered throughout Virginia by the Virginia Department of Conservation and Recreation's Division of Natural Heritage, is being used to ascertain the biological status and develop a complete list of the Commonwealth's macrolepidopteran moths.

RESULTS AND DISCUSSION

A total of 190 macrolepidopteran moth specimens was pinned and identified during the extended study period, bringing the total number of collected specimens at this site to 2,088. These collections increased the number of species documented at this site from 492 to 521 and the number of genera from 286 to 298. (Table 1 and Appendix). The Noctuidae (306 species) and Geometridae (101) were most diverse with the Arctiidae (34) and Notodontidae (32) also rich.

Using a checklist of confirmed and possible macro-moths from Virginia (Virginia Division of Natural Heritage, unpub. data) numbering 1314 species, one estimate of the percentage of the Commonwealth's macrolepidopteran fauna represented at the Vontay site is about 39%. If the Noctuidae of Virginia are similar in richness to the noctuid faunas of Ohio (Rings et al.,

1992) and Kentucky (Covell, 1999) with 708 and 616 species, respectively, an estimate of the percentage of the Commonwealth's noctuid fauna represented at the Vontay site is about 43 to 49%.

An updated species-accumulation curve (Fig. 1) for this study indicates that additional macros will be recorded at the site should collections continue. Depending upon the projected trajectory of the curve, estimates of the total number of taxa recorded from this site over 10 years range from 560 to 660 macro-moth species, representing perhaps as much as 50% of the state's estimated total macro fauna.

Table 1. Summary of macro-moths encountered during this study by family given in order of Hodges et al. (1983).

<u>FAMILY</u>	<u>NO. OF GENERA</u>	<u>NO. OF SPECIES</u>	<u>NO. OF SPECIMENS</u>
Thyatiridae	2	2	9
Drepanidae	3	3	6
Geometridae	69	101	382
Epiplemidae	2	2	5
Mimallonidae	1	1	6
Apatelodidae	2	2	4
Lasiocampidae	4	5	8
Saturniidae	10	11 ^a	10
Sphingidae	12	17 ^b	32
Notodontidae	17	32	135
Arctiidae	18	34	93
Lymantriidae	2	5	21
Noctuidae	158	306	1377
TOTALS	298	521	2088

^a Five species documented by sight records only

^b One species documented by sight record only

ACKNOWLEDGMENTS

Rebecca Wilson assisted with fieldwork. Steve Roble assisted with identifications and recruited help with determinations from knowledgeable lepidopterists including Doug Ferguson, Steve Hall, Eric Quinter, Dale Schweitzer, and Bo Sullivan. Manuscript preparation was funded in part by the Virginia Department of Conservation and Recreation, Division of Natural Heritage. All specimens are currently housed in the DNH reference collection.

Appendix. Additional macro moth species identified during this study given in order of Hodges et al. (1983). Fields are: checklist number, species name, collection date (month/day/year), method (s = sugar bait, b = black light, i = incandescent light, m = mercury vapor light); numbers in parentheses indicate if the number of specimens is >1 for a given date and survey method. A ? is added if the specimen identification was not confirmed by Ferguson, Hall, Quinter, or Schweitzer. Asterisks denote species new for the study.
