

## The Flora and Fauna of Virginia Army National Guard OMS No. 1 and No. 2 near Sandston, Henrico County, Virginia

Allen Belden, Jr. and Katharine L. Derge<sup>1</sup>

Virginia Department of Conservation and Recreation  
Division of Natural Heritage  
217 Governor Street  
Richmond, Virginia 23219

### INTRODUCTION

In 2000, the Virginia Department of Military Affairs contracted with the Virginia Department of Conservation and Recreation's Division of Natural Heritage (DCR-DNH) to conduct a biological inventory of plant and animal species on the lands included in Virginia Army National Guard (VA ARNG) installations Organizational Maintenance Shop (OMS) No. 1 and No. 2, located near Sandston, Virginia. The intent of the project was to provide VA ARNG with species lists of plants and animals found on the installations so as to document the presence, distribution, and status of significant elements of biodiversity. A major focus of the study was inventory for rare species listed under the federal Endangered Species Act of 1973, as amended, the Virginia Endangered Species Act, the Virginia Endangered Plant and Insect Act, and rare plant and animal lists maintained by DCR-DNH (Roble, 2001; Townsend, 2001). The practical goal of the inventory was to assist facility personnel in decisions concerning land use and management in the event that rare, threatened, or endangered species or significant natural communities were encountered.

### STUDY AREA

OMS No. 1 and No. 2 are located about 3 km SE of the town of Sandston in Henrico County, Virginia, and about 12 km ESE of Richmond. The property consists of 21.4 contiguous ha that are bordered by the Richmond International Airport to the west and by forested habitats to the north, south, and east. Other land uses in the area include low to high-density suburban development and agriculture.

The headwaters of White Oak Swamp (a creek) are located to the north of the property; this creek is a tributary of the Chickahominy River in the James River watershed. Two northeast-trending intermittent branches of White Oak Swamp cross the property. These streams and the small headwater seeps that feed them create a mosaic of forested upland and forested wetland habitats. Two vernal pools are located along these drainages. Elevations on the property range from 41 to 47 m.

The property is located within Virginia's Inner Coastal Plain physiographic province just east of the Fall Line. This province is characterized by poorly consolidated sediments eroded from highlands to the west and deeply underlain by the crystalline rocks characteristically exposed to the west in the Piedmont physiographic province. One major soil association is found on the property, Kempsville-Atlee-Duplin, which is characterized by deep, well-drained and moderately well-drained soils that have a dominantly sandy clay loam or clay subsoil (Clay, 1975). The climate of Henrico County is classified as humid subtropical, with warm to hot summers and mild winters and an average annual precipitation of 112 cm (Clay, 1975).

OMS No. 1 and No. 2 are active VA ARNG facilities used for training and light vehicle maintenance. U.S. government records indicate that the property has been owned by the U.S. Army and utilized by VA ARNG since the 1940s. Land use prior to this time is unknown (Shea & Smith, 1996).

Natural habitats within the survey area have been severely altered from pre-European settlement times, including hydrologic alterations in the form of stream channelization and ditching. Buildings and parking areas are confined to two areas on the southern and western perimeter of the property, and several roads, both paved and dirt, traverse the area. A perimeter fence surrounds the entire property, and a narrow strip along the inside of the fence is kept open by mowing. Other disturbed habitats include lawns, an infrequently-

---

<sup>1</sup>Present Address of KLD: Pennsylvania Fish and Boat Commission, Division of Environmental Services, 450 Robinson Lane, Bellefonte, PA 16823

mowed field, and an open utility right-of-way with both upland and saturated wetland habitats.

OMS No. 1 and No. 2 lie within Braun's (1950) Oak-Pine region, which includes Virginia's southern Piedmont and the Inner Coastal Plain north of the James River. This region is generally considered a transition zone where pines characteristic of the southeastern United States become more common in oak-dominated forests east of the Appalachians. Two of Virginia's natural community types as described by Fleming et al. (2001) have been identified on the property: Mixed Oak/Heath Forest and Coastal Plain/Piedmont Acidic Seepage Swamp.

Mixed Oak/Heath Forests are oak-dominated forests of infertile uplands with submesic to xeric moisture regimes and soils that are highly acidic (nutrient poor). The presence of thick duff layers and inflammable shrubs makes this community susceptible to frequent fires and, subsequently, favors the recruitment of oaks. At OMS No. 1 and No. 2, these upland oak species are *Quercus alba* (white oak), *Q. coccinea* (scarlet oak), *Q. falcata* (southern red oak), *Q. rubra* (northern red oak), *Q. velutina* (black oak), and *Q. stellata* (post oak). Pines are also important canopy associates; at OMS No. 1 and No. 2 *Pinus taeda* (loblolly pine) and *P. virginiana* (Virginia pine) are prevalent. Hickories are usually unimportant, and no hickory species were observed during the inventory. *Acer rubrum* (red maple) and *Nyssa sylvatica* (blackgum) are prevalent in the understory, and dense colonies of heath-family plants dominate the shrub layers. At OMS No. 1 and No. 2, abundant upland ericads include *Vaccinium pallidum* (early lowbush blueberry), *V. stamineum* (deerberry), *V. fuscatum* (hairy highbush blueberry), *Gaylussacia baccata* (black huckleberry), and *Rhododendron atlanticum* (dwarf azalea). Herbaceous species are sparsely distributed (Fleming et al., 2001).

Coastal Plain/Piedmont Acidic Seepage Swamps are oligotrophic (nutrient-poor) wetlands cloaked in deciduous or mixed forests. They are found along stream headwaters and toe-slopes where groundwater is discharged as surface seepage and slowly drained away as stream flow. Drainage patterns are generally diffuse in these saturated wetlands and typically characterized by braided channels interspersed with *Sphagnum*-covered hummocks. Substrates are sandy or peaty (Fleming et al., 2001). At OMS No. 1 and No. 2, this community type is poorly developed and has been disturbed by forest clearing, stream channelization, and ditching. Canopy species there include *Acer rubrum*, *Nyssa sylvatica*, and *Pinus taeda*; small trees and shrubs include *Magnolia virginiana* (sweetbay), *Clethra alnifolia* (sweet pepperbush), *Viburnum nudum* (possum-haw), and *Vaccinium formosum* (swamp

highbush blueberry). The herb layer is diverse and rich in sedge species, including *Carex lonchocarpa* (southern long sedge), *C. seorsa* (weak stellate sedge), and *C. scoparia* (pointed broom sedge).

## METHODS

### Botanical

Botanical fieldwork was conducted by author AB and consisted of seven site visits between April and October 2001. A list was compiled of all plant taxa encountered at OMS No.1 and No. 2. Species that could not be identified in the field were collected and identified later using standard floras for the area, including Fernald (1950), Radford et al. (1968), and Gleason & Cronquist (1991). A draft flora in progress, (Weakley 2000), was consulted for more recent treatments. Plant specimens that represented new county records as determined by Harvill et al. (1992) and updated information provided by one of its authors (G.P. Fleming) were pressed, labeled, and deposited at the herbarium of Virginia Polytechnic Institute and State University (VPI) in Blacksburg, Virginia.

Rare plant searches focused on *Helonias bullata* (swamp-pink) and *Isotria medeoloides* (small whorled pogonia). Both of these species are listed as federally threatened and state endangered. *Helonias bullata* is known to occur in the Coastal Plain/Piedmont Acidic Seepage Swamp natural community type, and a known population is located about 10 km ESE of OMS No. 1 and No. 2 (DCR-DNH, unpublished data). *Isotria medeoloides* occurs in infertile, mesic to submesic upland forests and appears to favor areas with sparse shrub and herb layers. Coastal Plain occurrences of this orchid in Virginia are known from Williamsburg City and the following counties: Caroline, Gloucester, James City, King William, and New Kent (Ware, 1991; DCR-DNH, unpublished data). The small size of the study area allowed for intensive searches for these two plants when appropriate habitats were encountered.

### Zoological

Zoological fieldwork was led by KLD and consisted of 30 site visits between April 2001 and April 2002. Inventory of animal species entailed a full complement of sampling techniques as follows:

1. Baited pitfall traps (PF) – Small 8 cm-diameter cups baited with rotting meat were buried with the rims at ground level and used for four days in June to attract carrion-feeding insects.

2. Bird surveys (BD) – Birds were inventoried using visual and aural survey techniques during three early morning (0600 h -1000h) site visits during the breeding season (May and June). In addition, owls were inventoried using tape playback calls for two nights in February.

3. Coverboards (CB) – Eight coverboards (ca. 0.6 x 1.2 m each) made of pressboard were placed in various locations at the onset of the inventory in May 2001 to assist in the survey of reptiles and amphibians. Boards were lifted during each subsequent site visit to determine the presence of targeted species.

4. Dip nets (DN) – Aquatic invertebrates were sampled with D-ring dip nets on three site visits in June and July.

5. Drift fences (DF) – Two drift fence arrays were established in May 2001 for the purpose of trapping reptiles, amphibians, small mammals, and invertebrates. Each array consisted of three 5 m lengths of aluminum flashing radiating out from a central pitfall trap made from a one-gallon can. Flashing was buried 10 cm into the ground in order to direct traveling animals towards pitfall traps that were installed at the end of each length. Pitfall traps were filled with equal parts antifreeze and 10% formalin to kill and preserve captures. A wire mesh was placed over pitfalls to discourage vertebrates from being caught, but was removed during nine trap nights of mammal trapping sessions (18-22 June, 13-16 August, 18-20 September).

6. Hand collection and visual/aural surveys (HV) – Reptiles and amphibians, as well as some invertebrates, were searched for and collected by hand in terrestrial habitats (12 hours of effort), where various cover objects were overturned in search of cryptic species. Opportunistic surveys for birds, amphibians, and mammals utilized visual and aural identification techniques.

7. Malaise trap (MA) – Flying insects were sampled with a Malaise trap set from mid-May to late August along an intermittent stream in the Coastal Plain/Piedmont Acidic Seepage Swamp community.

8. Minnow traps (MN) – Standard wire-mesh minnow traps were used to sample a variety of aquatic animals. Traps were baited with chicken livers and set overnight in shallow water for a total of seven nights in June.

9. Mist netting (MT) – Nocturnal bat surveys were conducted using 17 x 18 ft. (5.2 x 5.5 m) mist nets

placed across appropriate corridor and aquatic habitats. Nets were set up at dusk on two nights (14 August, 18 September) and checked regularly for 3-5 hours.

10. Sherman live traps (SH) – Traps for small mammals were placed along the drift fences as well as in various natural habitats. Traps were baited with oats and peanut butter and left open for a total of nine trap nights (18-22 June, 13-16 August, 18-20 September).

11. Sugaring (SU) – Some nocturnal insects that are not attracted to UV-light come to bait. The bait used was a mixture of fermented beer, fruit, and sugar, which was applied to tree trunks during the two mist netting sessions. Moths were collected with a kill-jar and non-lepidopterans were collected in alcohol.

12. Sweep nets (SW) – Lepidopterans, odonates, tiger beetles, and other flying invertebrates were sampled opportunistically on most site visits to both terrestrial and aquatic habitats using sweep nets.

13. UV-Light traps (UV) – Nocturnal lepidopterans and other invertebrates were captured using standard bucket traps equipped with a blacklight (= ultraviolet) powered by a 12-volt gel-cell battery with ethyl acetate used as a killing agent. Traps were run overnight in a variety of habitats for twelve trap nights during the May-October period. During the two mist netting sessions, a UV-light was used with a white sheet. Moths attracted to the sheet were collected in a kill-jar and non-lepidopterans were collected in alcohol.

All invertebrate specimens collected during the study were preserved using standard methods (Martin, 1977). All lepidopterans were mounted on pins, odonates were preserved with acetone and stored in glassine envelopes, and other insects were stored in 70% isopropyl alcohol. Frogs and toads were the only vertebrate specimens collected from the pitfall traps; specimens were transferred to 35% isopropyl alcohol. Most specimens have been or will be deposited in the Virginia Museum of Natural History; some specimens may be deposited in the National Museum of Natural History and the reference collection (primarily Lepidoptera and Odonata) of DCR-DNH.

## RESULTS AND DISCUSSION

### Botanical

A total of 325 vascular plant species and subspecific taxa was recorded for OMS No. 1 and No. 2 (Table 1). These taxa are contained within 189 genera

and 70 families. Four families, the Poaceae (55 taxa), Asteraceae (47 taxa), Cyperaceae (33 taxa), and Fabaceae (22 taxa) comprise 48.3% of the flora. *Carex* is by far the largest genus with 17 taxa. The 66 non-native taxa represent 20.3% of the flora.

Included among the non-native taxa is a new Virginia state record, *Cerastium dubium* (doubtful mouse-ear chickweed). This weedy species has previously been reported in North America from Illinois, Ohio, Kentucky, Tennessee, Arkansas, Mississippi, Oregon, Washington, and Idaho (Kartesz, 1999; Chester & Wofford, 2000). It is native to western France and Sicily to central Russia (Shildneck & Jones, 1986). Thirteen new Henrico County records were collected (Table 1).

Neither *Helonias bullata* nor *Isotria medeoloides* was found during the survey. The Coastal Plain/Piedmont Acidic Seepage Swamp community at OMS No. 1 and No. 2 is small and poorly developed. There did not appear to be sufficient seepage to support *Helonias*. Uplands at the study site are mostly cloaked in a dense ericaceous shrub layer; thus, it is not surprising that *Isotria* was not found. No other rare, threatened, or endangered plant taxa were located during the inventory.

#### Zoological

Sixty-eight species of vertebrates were identified at OMS No. 1 and No. 2 during the course of the inventory, including 9 amphibians, 8 reptiles, 3 fish, 42 birds, and 6 mammals (Table 2). Two groups that are not well represented in the results are salamanders and small mammals. No salamanders were discovered on the property despite extensive searches. The year of the survey was particularly dry, and this may account for the difficulty of locating salamanders on the surface. Small mammals are typically difficult to inventory and often require many trap nights for few captures. It is likely that other species of mice, voles, and shrews exist on the property, but only the white-footed mouse (*Peromyscus leucopus*) was captured.

Vertebrate species associated with aquatic habitats (fish, aquatic turtles, and frogs) were located exclusively in the semipermanently flooded habitats of a tributary to White Oak Swamp. All other vertebrates identified during the inventory were common throughout the study area, showing little habitat

specificity. No rare, threatened, or endangered species of vertebrates were expected from the survey area based on available habitats and regional patterns, and all vertebrate species identified in the inventory are considered common in the region. No new county records of vertebrates resulted from the inventory.

The majority of Lepidoptera and Odonata captured during the inventory have been identified, yielding 124 species of Lepidoptera, 16 of which were new county record butterflies and skippers (Opler et al., 1995), and 20 species of Odonata, including seven new county records (Carle, 1982; Table 2). Dragonfly species collected included *Libellula flavida* (yellow-sided skimmer), an uncommon species in Virginia (Carle, 1982). Numerous other invertebrates were collected but will not be identified in the near future due to funding and expertise constraints. No rare, threatened, or endangered species of invertebrates were identified during the inventory.

The method of inventory that yielded the greatest number of species was hand collection and visual surveys (i.e., opportunistic searching). Nevertheless, nine of the vertebrate species were captured with an intensive trapping method, such as the drift fence arrays, mist nets, or minnow traps, thus justifying continued use of labor- and material-intensive methods in comprehensive inventories.

#### ACKNOWLEDGMENTS

Funding for this inventory was provided by the Virginia Department of Military Affairs. We would like to thank the contract administrator, Major Gary Williamson, and the personnel of the facility, particularly Dan Seay, for their assistance with access to restricted areas and for providing logistical assistance and information on areas of interest. Thomas F. Wieboldt of Virginia Polytechnic Institute and State University assisted with the identification of plants collected for this project. DCR-DNH staff who assisted with data collection and processing are Anne C. Chazal, Gina M. Pisoni, Sandra Erdle, Philip A. Gipe, Steven M. Roble, Christopher S. Hobson, and J. Christopher Ludwig. Anne Chazal also assisted with manuscript revisions. The authors are grateful to two anonymous reviewers and the following individuals who reviewed a draft copy of this paper: John F. Townsend, Steven M. Roble, and Joseph C. Mitchell.

**Table 1. Flora of Virginia Army National Guard OMS No. 1 and No. 2 identified during DCR-DNH inventory, 2001.** The list is arranged by major plant groups: Pteridophyta (ferns and fern allies), Gymnospermae (non-flowering seed plants), and Angiospermae (flowering plants). The Angiospermae are further divided into the Dicotyledoneae and Monocotyledoneae. Within each major group, families, genera, species, and subtaxa are arranged alphabetically. Nomenclature and common names follow Kartesz (1999) with the exception of *Setaria pumila* (Poir.) Roemer & J.A. Schultes ssp. *pumila*, where it appears that the Kartesz name, *Pennisetum glaucum* (L.) R. Br., is in error (A. Weakley, pers. comm.). Synonyms, shown following an equal sign (=), are provided for some taxa where Kartesz (1999) departs sharply from other familiar sources. Non-native taxa, as determined from a consensus of the standard regional floras, are preceded by an asterisk (\*). Dates are listed as month-day-year. The last column shows the Allen Belden Jr. collection number for specimens deposited at VPI to voucher new Henrico County plant records.

**Table 2. Fauna of Virginia Army National Guard OMS No. 1 and No. 2 identified during DCR-DNH inventory, 2001-2002.** The list is arranged by major groups: vertebrates followed by invertebrates. Families, genera, and species are arranged alphabetically. Taxa preceded by a <sup>c</sup> were collected; all others were identified by sight or sound in the field. Taxa followed by an asterisk (\*) are potential county records (Carle, 1982; Opler et al., 1995). Dates are listed as month-day-year. See the Methods section for a key to the abbreviations for method of inventory. Nomenclature and identification sources included the following: American Ornithologists' Union (1998), Conant & Collins (1998), Covell (1984), Crother (2000), Dragonfly Society of the Americas (1996), Dunkle (2000), Glassberg (1999), Jenkins & Burkhead (1994), Kain (1987), Knisley & Schultz (1997), Linzey (1998), Miller (1992), Opler (1998), Page & Burr (1991), Peterson (1980), and Westfall & May (1996). Note that there is no standard list of common names for moths.
