

BANISTERIA

A JOURNAL DEVOTED TO THE NATURAL HISTORY OF VIRGINIA

ISSN 1066-0712

Published by the Virginia Natural History Society

The Virginia Natural History Society (VNHS) is a nonprofit organization dedicated to the dissemination of scientific information on all aspects of natural history in the Commonwealth of Virginia, including botany, zoology, ecology, archaeology, anthropology, paleontology, geology, geography, and climatology. The society's periodical *Banisteria* is a peer-reviewed, open access, online-only journal. Submitted manuscripts are published individually immediately after acceptance. A single volume is compiled at the end of each year and published online. The Editor will consider manuscripts on any aspect of natural history in Virginia or neighboring states if the information concerns a species native to Virginia or if the topic is directly related to regional natural history (as defined above). Biographies and historical accounts of relevance to natural history in Virginia also are suitable for publication in *Banisteria*. Membership dues and inquiries about back issues should be directed to the Co-Treasurers, and correspondence regarding *Banisteria* to the Editor. For additional information regarding the VNHS, including other membership categories, annual meetings, field events, pdf copies of papers from past issues of *Banisteria*, and instructions for prospective authors visit <http://virginiannaturalhistorysociety.com>/

ABSTRACT

Following an initial listing effort in the early 2000s that covered a portion of Virginia’s flora, we completed and updated the Coefficients of Conservatism (C-values) for all native and naturalized species and subspecific vascular plant taxa in Virginia. This included new rankings for 2038 of Virginia’s 3164 total species and sub-specific taxa, as well as updated rankings (as appropriate) for the “wetland” subset of the state’s taxa that had originally been listed in 2004. This effort marks the first comprehensive C-value list for the entire Virginia flora (not including the recent 2020 update). Future uses will include habitat evaluation and conservation planning based on the techniques of Floristic Quality Assessment (FQA), which will be facilitated through a web-available interface hosted by the Virginia Department of Environmental Quality.

Keywords: Floristic Quality Assessment (FQA), plant conservation, ecological indicators, floristic integrity, habitat assessment.

INTRODUCTION

Coefficients of Conservatism (C-values) are numerical assignments between 0 and 10 applied to plant species by an independent panel of botanical experts knowledgeable about the

flora of a particular region (Chamberlain et al., 2013). The C-value list provides a foundation for Floristic Quality Assessment (FQA), the term given to the calculation and subsequent analysis of weighted metrics originally developed in the Chicago region for evaluating the “quality” of native plant communities (Swink & Wilhelm, 1979, 1994). Quality is a relative term used to approximate similarity of a particular plant species assemblage to pre-settlement conditions in a similar habitat type (Maser, 1990). Implicit in its application is the notion that areas with species assemblages closer to those of pre-settlement times (i.e., prior to European colonization of North America) are more reflective of high-quality habitat (Nichols, 1999; DeBerry et al., 2015), and the assumption that certain types of anthropogenic disturbance represent vectors of introduction for “non-conservative” (e.g., invasive or cosmopolitan) species. It is important to note that “disturbance” is in itself a relative term that could be used to describe some human activities known to occur during pre-settlement times, such as incendiary fires set by Native Americans to clear patches of ground – activities that would also be categorized as “anthropogenic” (Noss, 1985). However, the concept of disturbance as it relates to FQA is most often associated with post-settlement events; that is, destructive anthropogenic disturbances such as logging and development following European occupation of the North American continent and the concurrent introduction of non-native plants (Chamberlain et al., 2013).

Recognizing the potential benefits of FQA in ecosystem assessment, the Virginia Department of Environmental Quality (DEQ) secured an Environmental Protection Agency (EPA) Wetland Development Grant in the early 2000s to develop a C-value list covering a subset of Virginia’s flora with a distribution in wetlands. At the time, the 1131 species included in that effort represented roughly 1/3 of Virginia’s total number of native and naturalized species. The resultant Virginia wetland C-value list was completed by DEQ in 2004. In the intervening years, through a monumental effort of several botanists and the leadership of the Flora of Virginia Executive Board, the first comprehensive manual of Virginia’s flora since the 1700s was compiled and published in 2012 and updated in 2020, providing updated taxonomic treatments, diagnostic keys, and descriptions for 3164 and 3348 species and sub-specific plant taxa, respectively (Weakley et al., 2012; Weakley et al., 2020)*. The publication of the *Flora*, along with recent technology innovations such as the release of the web-available *Flora of Virginia* mobile application (“Flora of Virginia App”; Weakley et al., 2020), have strengthened the resolve among scientists, managers, natural resource agencies, and others to use floristic quality as an assessment tool in Virginia.

Recent reviews on the use of FQA have highlighted the conservatism concept – the theoretical basis for C-value assignments – as the most valuable aspect of the FQA approach (Chamberlain et al., 2013; DeBerry et al., 2015). A key to the success of this concept is developing a *comprehensive* C-value list for all species and sub-specific taxa within a region, and this idea derives from the original authors of the FQA technique (Swink & Wilhelm, 1979, 1994). Although the original 2004 Virginia wetland C-value list has been used in multiple studies (e.g., DeBerry, 2006; Moser et al., 2007, Ahn & Dee, 2011; Dee & Ahn, 2012; DeBerry & Perry, 2015; Bosquet & Fleming, 2017; Dee et al., 2018), over the past decade-and-a-half it has become increasingly clear that the utility of this resource could not be fully realized until the remaining 2000+ native and naturalized species/sub-specific taxa also had C-value assignments. The purpose of this project was to fill this knowledge gap and finalize the C-value list for all of Virginia’s flora.

* The C-value list presented in this paper was finalized prior to the 2020 updates to the *Flora of Virginia*; taxa that were added in the 2020 version will be ranked in future efforts.

FLORA OF VIRGINIA C-VALUE ASSIGNMENT PANEL

The Flora of Virginia C-value Assignment Panel (hereafter “Panel”) was composed of a Panel Chair (primary author) and six other members (co-authors). The composition of this Panel collectively provided botanical expertise across the full sweep of Virginia geography, combining extensive field experience in all physiographic provinces with intimate knowledge of Virginia’s vast herbarium accessions. The Panel included three returning members of the 2004 C-value assignment committee (Doug DeBerry, Dave Davis, and Tom Wieboldt), which proved beneficial in promoting consistency between the prior and current listing efforts. Also included was one co-author of the *Flora of Virginia* (Chris Ludwig), and other members who had contributed species descriptions to the *Flora* and participated in the development of the *Flora of Virginia* App. Lastly, one Panel member (Doug DeBerry) had served on four other regional C-value assignment committees including the Mid-Atlantic C-value List (Chamberlain & Ingram, 2012) and the C-value listing effort for the EPA National Wetland Condition Assessment (Magee et al., 2014).

METHODOLOGY

The Panel assigned C-values to all species and subspecific taxa in the *Flora of Virginia* (Weakley et al., 2012) that were not previously assigned in 2004, which included 2038 taxa (Table 1). Panel members were encouraged to rank only those taxa that could be accurately assessed based on firsthand experience in the field. To keep the listing process consistent with the 2004 effort,

Table 1. Flora of Virginia C-value assignments – summary of taxa.

Category	Number	Notes
A Species and Subspecific Taxa in the FOV*	3164	From list provided by Flora of Virginia Project Executive Board (based on Weakley et al. 2012)
B VA Taxa Already Assigned C-values (2004)	1126	The original number was 1131, but 5 taxa from the 2004 list are not treated in the FOV
C VA Taxa Remaining to be Assigned	2038	= A – B
D Non-Native Taxa in FOV	566	These are the taxa designated with an asterisk (*) in the FOV; assigned a value of 0 if non-invasive, or -5, -3, or -1 based on high, medium, or low invasiveness, respectively (Heffernan et al. 2014)
E "Nativity Uncertain" Taxa in FOV	47	These are the taxa designated with an asterisk-question mark (*?) in the FOV (<i>input provided by Panel</i>)
F Both Native and Non-Native Populations in VA	10	These are the taxa designated with *(in part) in the FOV (<i>input provided by Panel</i>)
Taxa Left to Assign or Revise After Non-natives Removed:	1529	= C – D + E + F

* FOV = *Flora of Virginia* (Weakley et al. 2012)

non-native taxa (566 total) automatically received a value of “0”; however, negative values were applied to some non-native invasive taxa as described below. In addition to the new assignments, the Panel rectified the 2004 list with taxonomy, nativity, and distribution information from the *Flora of Virginia* (Weakley et al., 2012) and reviewed the 2004 list for potential C-value revisions. After non-native taxa were automatically assigned, the remaining 1529 taxa were left for the Panel to rank. The values given by the seven panelists were averaged to decide the final C-value presented in the Appendix. Taxa that were given different C-values by the seven Panel members (at least one outside the standard deviation of the average) were opened to discussion before finalizing the value.

C-Value Assignment Categories

The Panel used the same assignment categories provided for the 2004 list, with some minor phrasing revisions to make the categories more consistent with the current scientific literature on FQA. The categories are summarized in Table 2. In addition, the current list adopted negative values for non-native invasive species consistent with the Virginia Invasive Plant Species List (Heffernan et al. 2014). The organization of the Virginia Invasive Plant Species List into ranks of either “high”, “medium”, or “low” risk of invasion facilitated a convenient corresponding C-value assignment of -5, -3, and -1 for non-native invasive species, respectively. All other non-native species (i.e., non-native, non-invasive) retained a C-value of 0, which was consistent with the 2004 list.

Table 2. Flora of Virginia C-value categories.

C-Value Range	Ranking Criteria
-5, -3, -1	High, medium, and low invasiveness rank, respectively (Heffernan et al. 2014).
0	Non-native, non-invasive taxa.
1-3	Ruderal or “weedy” plants with a characteristically broad ecological amplitude and low fidelity to high quality natural communities. These taxa are often opportunistic colonizers and are tolerant of anthropogenic disturbance.
4-7	Plants with an intermediate range of ecological tolerances and moderate expression of fidelity to high quality natural communities. These taxa typify a stable phase of some natural community but persist under minor anthropogenic disturbances.
8-10	Plants that exhibit a high degree of fidelity to high quality natural communities and are typically intolerant of anthropogenic disturbance. Such taxa tend to have a localized distribution and/or are edaphically restricted with a characteristically narrow ecological amplitude and a high degree of fidelity to a narrow range of synecological parameters.

Master C-value List – Flora of Virginia

Prior to initiating the listing procedure, the Panel Chair (DeBerry) developed a master file in Microsoft Excel for the panelists to use throughout the project. The full list of species and subspecific taxa from the *Flora of Virginia* (Weakley et al., 2012) were provided in database format by the Flora of Virginia Project (Bland Crowder, Executive Director), but rectifying the

2004 list with the current *Flora* required extensive nomenclature updates as many of the names on the 2004 list have been revised. To accomplish this, the Chair developed a series of overlapping database lookup functions to automatically match synonyms where possible, followed by a quality check to update all remaining taxa from the 2004 list with current nomenclature. This process was also repeated for the Mid-Atlantic C-value list (see below) so that C-values from that database could be provided for reference.

Once created, the Master C-value List was provided to all Panel members with the following information:

- List of all species and subspecific taxa contained in the *Flora of Virginia* (Weakley et al. 2012);
- Mid-Atlantic C-value List (Chamberlain & Ingram, 2012), provided for reference; and,
- Virginia 2004 wetland C-value List – provided for reference.

The 2004 C-values were automatically imported into the file and populated in the active listing column. In addition, Virginia non-natives (0) and non-native invasive species (-5, -3, or -1) were populated for the current list. The remaining blank cells were to be filled independently by each individual Panel member with new C-value ranks. The list was sorted in the same order as the taxa are presented in the *Flora of Virginia* (i.e., lycophytes→pteridophytes→gymnosperms →dicots→monocots), then within each of these groups, alphabetically by family, genus, and finally species (or subspecific taxon). Panelists were asked to keep the list in the same order as presented in the spreadsheet, which allowed for easier post-processing of the data.

Lastly, panelists were reminded that the Mid-Atlantic C-value list, which was provided in the master list as a general reference, does not translate directly to the Virginia list because the Mid-Atlantic list does not include C-values for non-native species. Therefore, a “0” on the Mid-Atlantic list is equivalent to a *native* species with no fidelity to natural communities and the highest tolerance to anthropogenic disturbance, which would be a “1” on the Virginia list. For this reason, panelists using the Mid-Atlantic list as a point of reference were encouraged to factor in the difference in scale [i.e., a “4” on the Mid-Atlantic list might be more likely to correspond to a “5” on the VA list, but this correspondence is not perfect since there are 11 categories for native plants on the Mid-Atlantic list (0-10) and only 10 categories for the VA list (1-10)].

RESULTS AND DISCUSSION

As indicated in Table 1, 1529 taxa were ranked by the Panel. An additional 39 taxa from the original 2004 list were flagged for further consideration, and these were either revised or verified in subsequent meetings/correspondence. The list was delivered on May 29, 2020 (DeBerry, 2020), with all 3164 Virginia native and naturalized species and subspecific plant taxa from Weakley et al. (2012) accounted for and updated with current C-values. The final alphabetically-sorted Flora of Virginia C-value List is provided in the Appendix.

The mean C-value for the entire Virginia flora is 5.05, and the mean C-value for the native Virginia flora is 6.37. Based on a comprehensive review by Bried et al. (2012) this native flora result compares favorably with other state lists, particularly in the northeast region (e.g., Connecticut=6.60, Massachusetts=5.45, New Hampshire=4.85, Rhode Island=5.17, Vermont=6.09). The distribution of Virginia C-values is shown in Figure 1. The most frequently assigned value was 7, followed by 0 for non-native, non-invasive taxa. For comparison, the

frequency histogram for the original 2004 C-value list is provided in Figure 2, which shows a distribution very similar to the current list (albeit a smaller subset).

Future use of the updated Flora of Virginia C-value List will be facilitated through development of a web-based FQA calculator, which will be hosted by the Virginia DEQ. The Panel Chair is currently developing that web-based tool, which is anticipated to be available for public use by the end of 2021. An important outcome of this project is that the final list is comprehensive, providing a much-needed foundation from which to facilitate future revisions based on changes to the state's flora. This will be particularly important with respect to ongoing taxonomic/nomenclatural changes, additions to Virginia's flora through range expansions, and research-based discoveries related to plant conservatism (e.g., Weakley et al., 2020).

ACKNOWLEDGEMENTS

This project was completed under a Wetland Development Grant (WDG) from the EPA (PTE Federal Award No. BG-98392506-0), which was administered by the Virginia Institute of Marine Science (VIMS) on behalf of DEQ. We specifically thank Kirk Havens (VIMS) and Michelle Henicheck (DEQ) for advocacy in securing the grant and help in facilitating meetings. The Flora of Virginia Project Executive Board was very forthcoming with the necessary master list of Virginia's taxa, which was presented in a database format that was easily incorporated into this project; thanks especially to Bland Crowder (Executive Director) for his quick response with that invaluable resource. Thanks to Randee Humphrey, Kristin Thoroman, and the other staff at Lewis Ginter Botanical Garden in Richmond, Virginia for graciously allowing us to hold our meetings in their excellent education wing. Finally, we greatly appreciate the helpful comments received on an earlier draft of this paper from Dr. Todd Fredericksen and two anonymous reviewers.
